AN ORDVAC PROGRAM FOR THE TRANSFORMATION OF GEODETIC ELLIPSOIDAL COORDINATES INTO CARTESIAN COORDINATES AND VICE VERSA

ABSTRACT

The transformation of geodetic ellipsoidal coordinates into Cartesian coordinates and vice versa is programmed for the ORDVAC using a pseudo code - "The One Address Floating Binary Double Precision Code (OFBDP)."

I. THE MATHEMATICAL BASIS OF THE COORDINATE TRANSFORMATION¹

With reference to Fig. 1, the following notation for the constants of the reference ellipsoid becomes self-explanatory.

Major axis	a
Minor axis	b
Eccentricity	$e^2 = \frac{a^2 - b^2}{a^2} = 1 - (b/a)^2$

(1)

The null meridian is denoted by $(\lambda)_0$.

Fig. 2 presents the plane of the meridian λ_1 .

$$\frac{s^2_p}{a^2} + \frac{z^2_p}{b^2} = 1 \quad (2)$$

Furthermore,

$$\frac{s_p}{a} = \cos \psi, \text{ where } \psi \text{ is the "reduced latitude".} \quad (3)$$

From the fundamental identity

$$\sin^2 \psi + \cos^2 \psi = 1 \quad (4)$$

and from (2) and (3) it follows that

$$\frac{z_p}{b} = \sin \psi \quad (5)$$

and again with (2), we obtain

$$\tan \psi = \frac{z_p}{\frac{s_p}{a}} \cdot \frac{a}{b} \quad (6)$$

1. Schmid, H. Some Remarks on the Problem of Transforming Geodetic Ellipsoidal Coordinates into Cartesian Coordinates with the Help of The Reduced Latitude, Ordnance Computer Research Report, Ballistic Research Laboratories, Aberdeen Proving Ground, Maryland, Vol. VI, No. 2, 15 April 1959

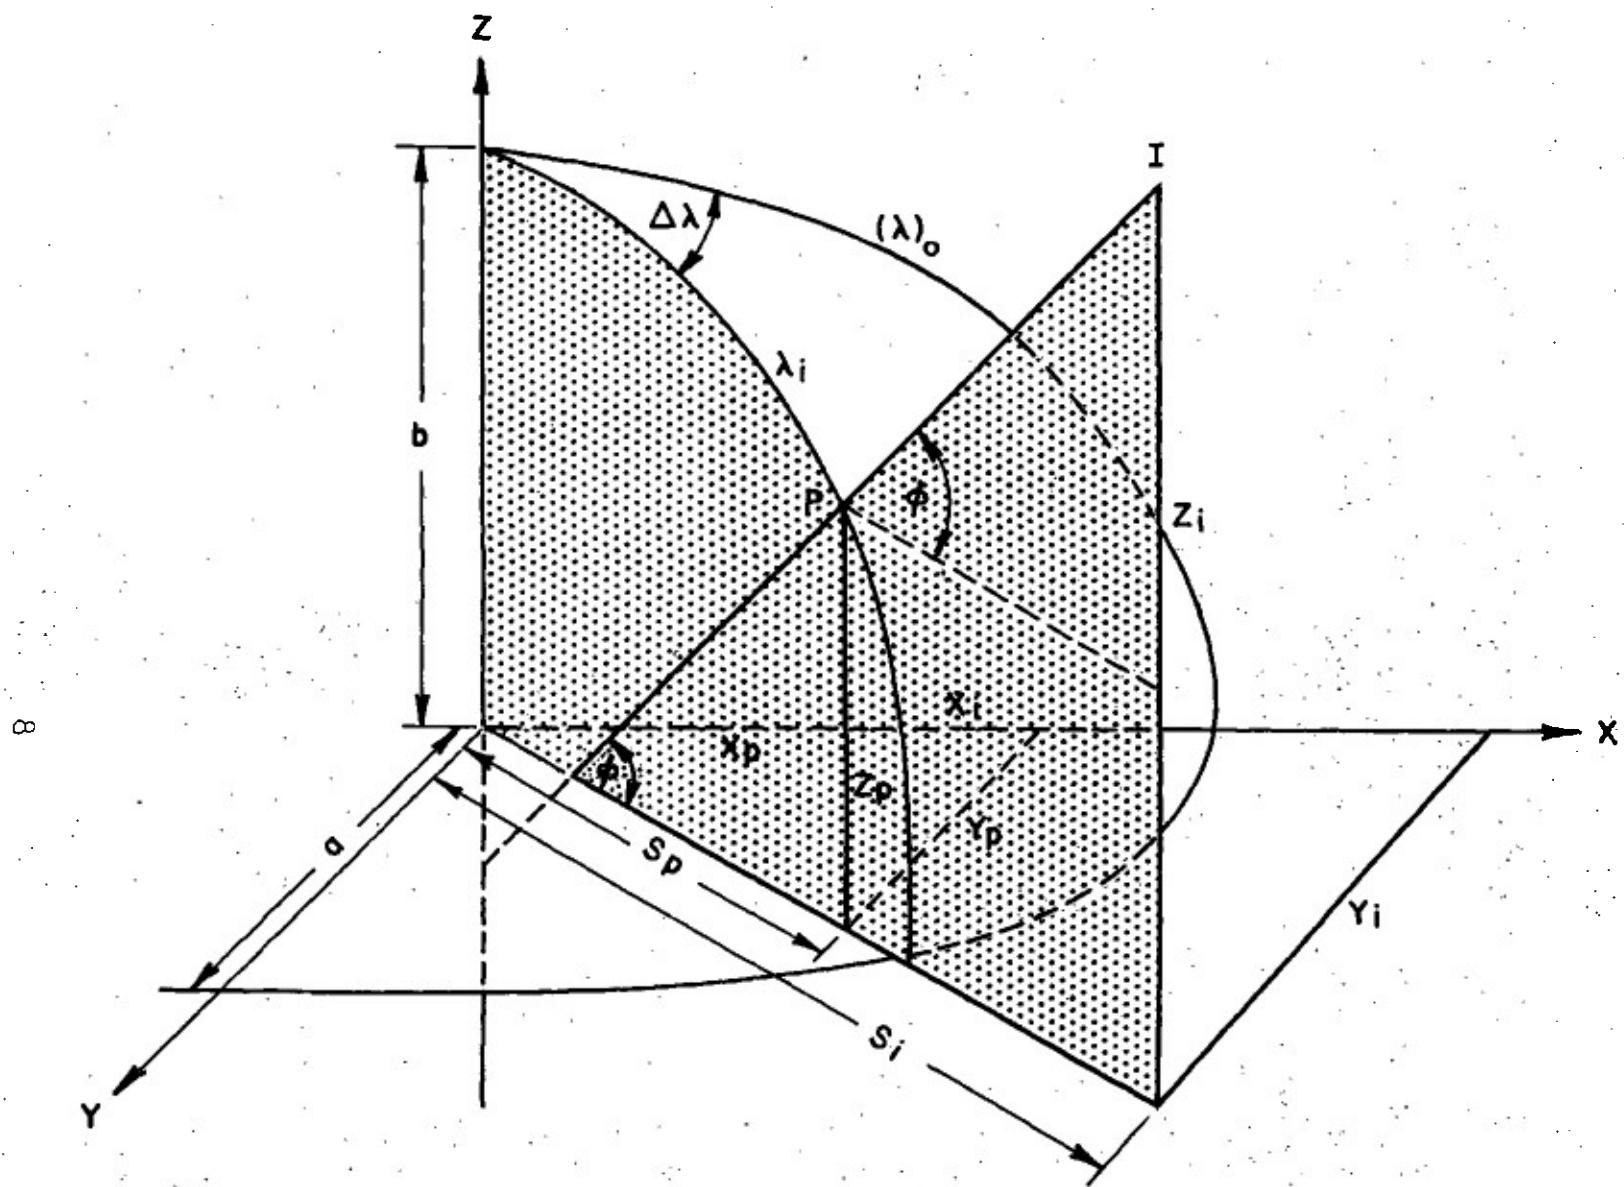

FIGURE 1

FIGURE 2

which is conveniently written by introducing the geocentric latitude γ , as

$$\tan \psi = \frac{a}{b} \tan \gamma. \quad (7)$$

From $\tan \phi = \frac{a^2}{b^2} \tan \gamma.$ (8)

follows $\tan \phi = \frac{a^2}{b^2} \tan \psi.$ (9)

Furthermore from Fig. 2

$$\tan \phi = \frac{z_1 - z_p}{\frac{s_i^2}{s_i} - s_p}. \quad (10)$$

Substituting (3) and (5) into (10), we obtain with (9) and (1)

$$\tan \psi - \frac{ae^2}{s_i^2} \sin \psi - \frac{b}{a} \cdot \frac{z_1}{s_i} = 0 \quad (11)$$

which leads to an expression of fourth degree explicit in terms of $\tan \psi.$

In order to avoid a cumbersome solution a well known series is considered.

$$\begin{aligned} \tan(\psi^o + \Delta\psi^o) &= \tan \psi^o + (1 + \tan^2 \psi^o) \Delta\psi + \\ &\quad (1 + \tan^2 \psi^o) \tan \psi^o \Delta\psi^2 + \dots \end{aligned} \quad (12)$$

where,

$$\psi = \psi^o + \Delta\psi. \quad (13)$$

By neglecting all terms higher than first order

$$\Delta\psi^o = - \frac{\tan \psi^o - \sin \psi^o \frac{ae^2}{s_i^2} - \frac{b}{a} \cdot \frac{z_1}{s_i}}{1 + \tan^2 \psi^o - \cos \psi^o \frac{ae^2}{s_i^2}} \quad (14)$$

where,

$$\tan \psi^o = \frac{a}{b} \cdot \frac{z_1}{s_i} \quad (15)$$

With the above derived formulas geodetic ellipsoidal coordinates can readily be converted into geocentric Cartesian coordinates and vice versa. The transformation here is based on formula (9) using the reduced latitude, ψ , as an auxiliary angle. Thus, fewer iterations are required in determining the value of $\Delta\psi^o$ by formula (14) than would be required if similar expressions for $\Delta\gamma$ corrections were derived.

The second phase of coordinate transformation is concerned with the transformation of the geocentric Cartesian coordinates (XYZ), as obtained in the first step, into a system of local Cartesian coordinates (xyz) and vice versa. In order to obtain a high degree of flexibility it is desirable to provide for the possibility of referring the geocentric coordinate system to an arbitrarily chosen meridian, denoted by (λ). For a coordinate transformation to be suited for geodetic and photogrammetric purposes, particular attention should be given to the fact that generally the position of any local point of origin will be given by geodetic ellipsoidal coordinates denoted by ϕ_o , λ_o , H_o . By introducing $(\lambda) = \lambda_o$ the geocentric Cartesian system becomes oriented in such a way that its X-axis is situated in the meridian plane of the arbitrarily chosen point of origin of the local Cartesian system. During the computations, first the Cartesian geocentric coordinates of the point of origin ($X_o Y_o Z_o$) are computed. In case the above described rotation $(\lambda_1 - \lambda_o)$ is applied, $Y_o =$ zero. Next the geocentric system is translated parallel to itself, into the origin of the local system by the translations, $X_o Y_o Z_o$. The $x'y'z'$ - system thus obtained must now be oriented by three additional rotations. These rotations should be made in such a way that the orientation of the local system can be made to be significant in terms of commonly used geodetic parameters. First, we rotate around the y-axis for an angle α . With $Y_o =$ zero and $\alpha = (90 - \phi_o)$ the xy-plane becomes parallel to a plane tangent to the ellipsoid at the sub-origin point. Second, we rotate around the once rotated z' - axis (β - rotation). If the xy-plane is tangent to the ellipsoid at the sub-origin point, this step corresponds to the conventional azimuth rotation. The third rotation, denoted by γ , is

executed around the twice rotated x' - axis. In most geodetic problems γ will equal zero. The necessary computations, described above are made by the following well known formulas which transfer one set of Cartesian coordinates into another:

A. Direct Transformation

$$\begin{aligned}x'_1 &= + x'_1 (\cos \alpha \cos \beta) \\&\quad + y'_1 (\sin \beta) \\&\quad - z'_1 (\sin \alpha \cos \beta)\end{aligned}$$

$$\begin{aligned}y'_1 &= + x'_1 (\sin \alpha \sin \gamma - \cos \alpha \sin \beta \cos \gamma) \\&\quad + y'_1 (\cos \beta \cos \gamma) \\&\quad + z'_1 (\cos \alpha \sin \gamma + \sin \alpha \sin \beta \cos \gamma) \\z'_1 &= + x'_1 (\sin \alpha \cos \gamma + \cos \alpha \sin \beta \sin \gamma) \\&\quad - y'_1 (\cos \beta \sin \gamma) \\&\quad + z'_1 (\cos \alpha \cos \gamma - \sin \alpha \sin \beta \sin \gamma)\end{aligned}$$

B. Inverse Transformation

$$\begin{aligned}x'_1 &= + x_1 (\cos \alpha \cos \beta) \\&\quad + y_1 (\sin \alpha \sin \gamma - \cos \alpha \sin \beta \cos \gamma) \\&\quad + z_1 (\sin \alpha \cos \gamma + \cos \alpha \sin \beta \sin \gamma)\end{aligned}$$

$$\begin{aligned}y'_1 &= + x_1 (\sin \beta) \\&\quad + y_1 (\cos \beta \cos \gamma) \\&\quad - z_1 (\cos \beta \sin \gamma)\end{aligned}$$

$$\begin{aligned}z'_1 &= - x_1 (\sin \alpha \cos \beta) \\&\quad + y_1 (\cos \alpha \sin \gamma + \sin \alpha \sin \beta \cos \gamma) \\&\quad + z_1 (\cos \alpha \cos \gamma - \sin \alpha \sin \beta \sin \gamma)\end{aligned}$$

II. FORMULAS USED IN THE PROGRAMMING PHASE

A. 14. Direct Transformation

a. Given: The ellipsoidal coordinates of the point of origin O (ϕ_o, λ_o, H_o) and I, (ϕ_i, λ_i, H_i) where longitudes λ_o and λ_i are referred to the null meridian denoted by (λ) .

b. Compute the Cartesian geocentric coordinates (X_o, Y_o, Z_o) and X_i, Y_i, Z_i , whereby the + X-axis passes through the point $\phi = 0, \lambda = (\lambda)$ and the + Z-axis passes through the point $\phi = + 90^\circ$.

$$(1) \text{ From (9)} \quad \tan \psi = \frac{b}{a} \tan \phi \quad (16)$$

$$(3) \quad S_p = a \cos \psi \quad (17)$$

$$(5) \quad Z_p = b \sin \psi \quad (18)$$

(2) From Fig. 2

$$S_i = S_p + H \cos \phi \quad (19)$$

$$X_i = S_i \cos [\lambda_i - (\lambda)] \quad (20)$$

$$Y_i = S_i \sin [\lambda_i - (\lambda)] \quad (21)$$

$$Z_i = Z_p + H \sin \phi \quad (22)$$

c. Transform the Cartesian geocentric coordinates X_i, Y_i, Z_i to local Cartesian coordinates x_i, y_i, z_i .

(1) Translations

$$x'_i = X_i - X_o \quad (23)$$

$$y'_i = Y_i - Y_o \quad (24)$$

$$z'_i = Z_i - Z_o \quad (25)$$

(2) Rotations

$$x_i = + x'_i (\cos \alpha \cos \beta) \quad (26)$$

$$+ y'_i (\sin \beta)$$

$$- z'_i (\sin \alpha \cos \beta)$$

$$y'_1 = + x'_1 (\sin \alpha \sin \gamma - \cos \alpha \sin \beta \cos \gamma) \quad (27)$$

$$+ y'_1 (\cos \beta \cos \gamma)$$

$$+ z'_1 (\cos \alpha \sin \gamma + \sin \alpha \sin \beta \cos \gamma)$$

$$z'_1 = + x'_1 (\sin \alpha \cos \gamma + \cos \alpha \sin \beta \sin \gamma) \quad (28)$$

$$- y'_1 (\cos \beta \sin \gamma)$$

$$+ z'_1 (\cos \alpha \cos \gamma - \sin \alpha \sin \beta \sin \gamma)$$

B. 2. Inverse Transformation

a. Given: The local Cartesian coordinates of point I (x_i, y_i, z_i) and the Cartesian geocentric coordinates of the corresponding point of Origin O (X_o, Y_o, Z_o).

b. Transform the local Cartesian coordinates x_i, y_i, z_i into Cartesian geocentric coordinates X_i, Y_i, Z_i .

(1) Rotations

$$x'_1 = + x_i (\cos \alpha \cos \beta) \quad (29)$$

$$+ y_i (\sin \alpha \sin \gamma - \cos \alpha \sin \beta \cos \gamma)$$

$$+ z_i (\sin \alpha \cos \gamma + \cos \alpha \sin \beta \sin \gamma)$$

$$y'_1 = + x_i (\sin \beta) \quad (30)$$

$$+ y_i (\cos \beta \cos \gamma)$$

$$- z_i (\cos \beta \sin \gamma)$$

$$z'_1 = - x_i (\sin \alpha \cos \beta) \quad (31)$$

$$+ y_i (\cos \alpha \sin \gamma + \sin \alpha \sin \beta \cos \gamma)$$

$$+ z_i (\cos \alpha \cos \gamma - \sin \alpha \sin \beta \sin \gamma)$$

(2) Translations

$$X_1 = x'_1 + X_o \quad (32)$$

$$Y_1 = y'_1 + Y_o \quad (33)$$

$$Z_1 = z'_1 + Z_o \quad (34)$$

c. Compute the corresponding ellipsoidal coordinates ϕ_i, λ_i, H_i .

From Fig. 2

$$\tan \Delta\lambda = \frac{Y_1}{X_1} \quad (35)$$

$$\text{and } \lambda_1 = (\lambda) + \Delta\lambda \quad (36)$$

Furthermore,

$$S_1 = (X_1^2 + Y_1^2)^{\frac{1}{2}} \quad (37)$$

From (15)

$$\tan \psi^o = \frac{Z_1}{S_1} \cdot \frac{a}{b} \quad (38)$$

From (14)

$$\Delta\psi^o = - \frac{\tan \psi^o - \sin \psi^o \frac{ae^2}{S_1} - \frac{b}{a} \cdot \frac{Z_1}{S_1}}{1 + \tan^2 \psi^o - \cos \psi^o \cdot \frac{ae^2}{S_1}} \quad (39)$$

From (13)

$$\psi = \psi^o + \Delta\psi^o \quad (40)$$

From (9)

$$\tan \phi_i = \tan \psi \cdot \frac{a}{b} \quad (41)$$

From Fig. 2

$$H = \frac{S_1 - a \cos \psi}{\cos \phi_i} \quad (42)$$

V. THE CODE

A. PROGRAM

"The One Address Floating Binary Double Precision (OFBDP)" devised by Lloyd Campbell, Computing Laboratory, Ballistic Research Laboratories, was applied to this problem. Instruction on the use of the code may be found in ERL Report No. 997, October 1956, "Programming and Coding for ORDVAC", by Tadeusz Leser and Michael Romanelli.

VI. CONSTANTS

The following floating decimal constants with 22 decimal digits were converted to sexadecimal form for input with the program in order to maintain maximum accuracy, especially in converting degrees, minutes, and seconds to radians:

+ .1000	0000	0000	0000	0000	00	- 16	constant
+ .1745	3292	5199	4329	5769	00	- 01	radians = 1°
+ .2908	8820	8665	7215	9615	00	- 03	radians = 1'
+ .4848	1368	1109	5359	9359	00	- 05	radians = 1"
+ .1000	0000	0000	0000	0000	00	+ 01	constant
+ .5000	0000	0000	0000	0000	00	- 06	iterative constant
+ .3141	5926	5358	9793	2384	60	+ 01	π
+ .6000	0000	0000	0000	0000	00	+ 02	constant
+ .2000	0000	0000	0000	0000	00	+ 01	constant

VII. DATA

A. FORMAT

The data cards are punched using standard floating decimal form (S8-S2) - [coefficient (sign and 8 digits) with exponent (sign and 2 digits)] or (S10-S2) - [coefficient (sign and 10 digits) with exponent (sign and 2 digits)]. The sign is in a separate column using "0" punch or no punch for plus and "X" for minus.

B. INPUT AND OUTPUT

The data input has 10 (S10-S2) decimal digits while the output may either be with 8 (S8-S2) or 10 (S10-S2) decimal digits. The input cards contain five 10-digit floating decimal numbers. Card No. 1 contains information designating form of output and signal for direct or inverse transformation.

The option card placed before "transfer to program" card is used to print six (S8-S2) numbers which include information such as weight, point type, and point number, in addition to the local Cartesian coordinates. This form of output is prepared for use with the photogrammetric camera orientation program.

Card No. 1:

a	b	$\pm .1$	$\pm .1$	weight
---	---	----------	----------	--------

↑ ↑ ↑
only used in option
← + = output S10 - S2
← - = output S8 - S2
← + From geodetic ellipsoidal coordinates to local
Cartesian coordinates
← - From local Cartesian coordinates to geodetic
ellipsoidal coordinates

See sample input for remainder of cards.

If a minus angle is used minus must be punched with all three values, i.e. degrees, minutes, and seconds.

Follow each case by a card with .1 punches in columns 57 and 58.
As many cases as desired may be run by stacking one after the other.

For output see samples.
